Key insights

Espresso drives the most revenue, but chai tea sells more cups. Barista Espresso is the top revenue generator (\$91,406), yet Brewed Chai tea moves more units (26,250 vs 24,943) — see Fig. 1 and Fig. 5. Espresso simply carries a higher price point per order.

Coffee and tea together drive two-thirds of all revenue. The Coffee category alone accounts for \$269,952 (38.6% of total revenue) and Tea a further \$196,406 (28.1%) — see Fig. 3.

There is a clear mid-morning peak. Revenue climbs steadily from open and peaks at 10:30 (\$44,967 in that single 30-minute window, 9,300 transactions) — see Fig. 2.

Trading is slowest at open and close. The 06:00 interval (\$6,621) and the 20:00–20:30 close-out window (\$1,327 and \$1,609) are the weakest of the day — roughly 3–28x lower than the 10:30 peak.

Afternoon revenue is flat, not declining. From 11:30 through 18:00, revenue holds steady around \$19,500–\$21,500 per interval — a stable but unremarkable stretch, distinct from the strong morning rush and weak evening close.

A handful of low-revenue product types exist at the tail. Green beans (\$1,340), Green tea (\$1,471), and Organic Chocolate (\$1,680) are the lowest revenue-generating product types, each earning under 2% of what the top product earns.

Recommendations

1. Run marketing campaigns during slow time slots

The 06:00 opening hour and the 20:00–20:30 close both under-perform relative to the rest of the day (roughly **3–28 times lower** revenue than the 10:30 peak). A targeted early-bird discount or a last-call promotion in these windows could lift otherwise idle trading time without disrupting the strong late-morning rush.

2. Stock more of the best-selling items

Brewed Chai tea, Gourmet brewed coffee, and Barista Espresso are the three highest-volume product types (Fig. 5). Prioritizing inventory and prep capacity for these — especially in the 08:00–10:30 rush window — reduces the risk of stockouts during the busiest, most revenue-dense part of the day.

3. Promote underperforming products

Green beans, Green tea, and Organic Chocolate sit at the bottom of the revenue ranking. Bundling these with best-sellers, featuring them in loyalty rewards, or testing limited-time promotions would help determine whether they're underperforming due to low awareness or genuinely low demand — informing a future decision to promote or discontinue.

Next steps

1

Automate daily sales reporting

Schedule the Databricks cleaning and aggregation queries to run daily, feeding this dashboard automatically so the CEO always sees current performance without manual exports.

2

Track performance across locations

Extend the current single-location view to compare Astoria, Hell's Kitchen, and Lower Manhattan side by side, so location-specific trends and opportunities aren't hidden in the aggregate numbers.

3

Implement loyalty programs by peak time slot

Design loyalty incentives around the identified peak (10:30) and slow (06:00, 20:00–20:30) windows — rewarding off-peak visits specifically to help smooth demand across the day.
